

Passwords Decay Words Endure: Secure and Re-usable Multiple Password Mnemonics

Umut Topkara, Mikhail J Atallah, Mercan Topkara

Department of Computer Science
Purdue University
West Lafayette, 47906, IN, USA

What is your password?

- Random strings
- Difficult to remember
- Harder to remember many at the same time

Alternate Solutions

- Require change in infrastructure
 - Graphical passwords, tokens, etc.
- Require trusted computing power
 - Browser plugins, PDA, tokens, etc.

Security Usability Trade-off

- Our Approach: Make passwords more usable
 - Write down your passwords *
 - Complement with secure password mnemonics
 - Something you **have**
 - Something you **know**

Mnemonic Sentence

* Jesper Johansson, Bruce Schneier

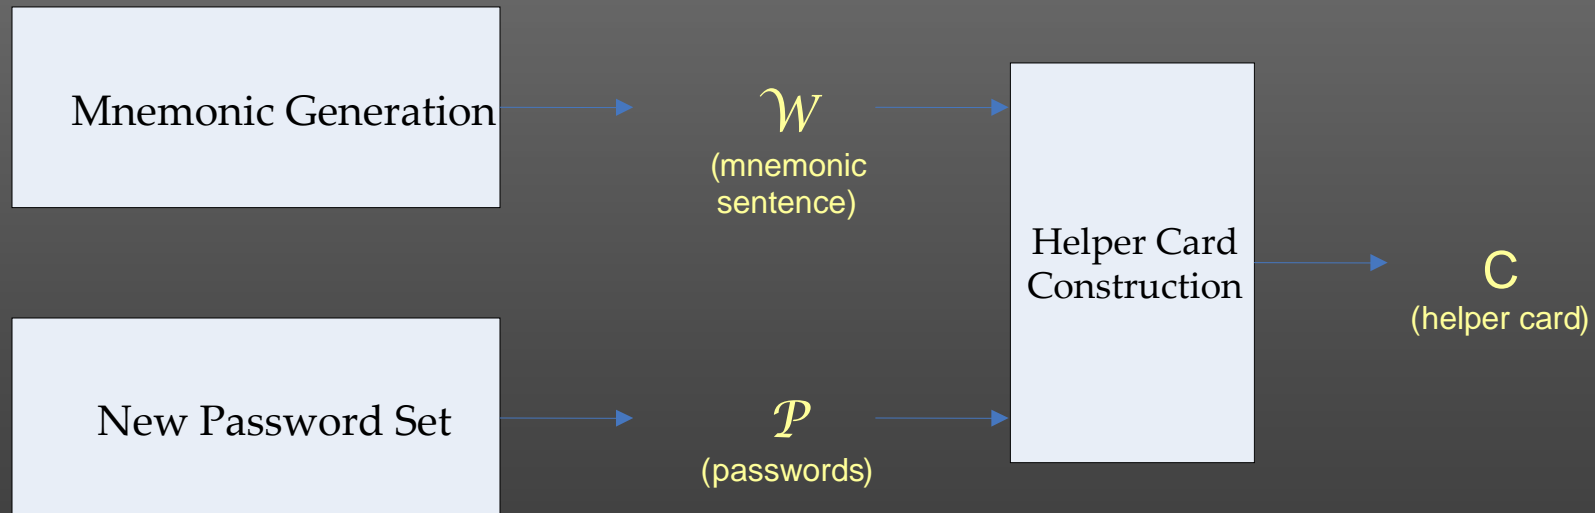

EMPATHE:

rEusable Mnemonics for Password AuTHentication

- Automatically generated mnemonics
- Support truly random passwords
- Handle multiple passwords with same mnemonic
- No domino effect in password compromise
- Write down a complete description of the password
- Easy user reconstruction of the passwords
- No requirement of additional computing power
- No change in existing infrastructure
- Compatible with existing passwords
- Keep the mnemonic, change the password

Usage Scenario

- Select a mnemonic sentence
- Choose strong passwords
- Print a helper card
- Authenticate

Authentication with Helper Card

- “The birth of ice-cream: why and how we sneeze at midnight.”

	a	b	c	d	e	f	g	h	i	j	k	l	m	n	o	p	q	r	s	t	u	v	w	x	y	z

	-1	/	0	/	=	i	6	=	v	x	6	=	6	6	v	?	0	v	0	0	&	?	=	/	=	=	=

Helper Card

- Secret Sharing
- Without Encryption
 - Random P
 - Random R_s
 - Public ($P \text{ XOR } R_s = R_h$)
- $e(R_s) = W = d^{-1}(R_s)$ (e.g., $W = \text{“birth”}$)
- $R_s = d(W) = d(W[1]).d(W[4]).d(W[-3]).d(W[-1])$
 $d(\text{birth}) = d(b).d(t).d(r).d(h)$
- $p_i = d(W[j]) \text{ XOR } r_{h,i} = \text{lookup}(i, W[j])$
- $\text{lookup}(i, W[j]) = d(W[j]) + z \text{ mod}(95)$

Helper Card Security

- Adversary with password file:
 - Offline cracking
 - 95^8 equally probable passwords
- Adversary with helper card:
 - Login trials
 - 9^4 possible passwords per account
 - Most systems regulate login trials

Multiple Passwords

- Adversary with one password
 - No domino effect
 - Passwords independently chosen
- Adversary **also** with helper card
 - T-?4!5Fv → “birth”
 - $P(\text{ice-cream}) = P(\text{ice-cream} \mid \text{birth})$
 - Mnemonic sentence generation

Mnemonics

- Reminder for hard to remember information
 - e.g. unrelated sequence of objects
 - My Very Eager Mother Just Sewed Us New Pajamas
- [Miller 1956, *Human Memory And The Storage Of Information*]:
 - Semantic association: Associate a meaning
 - e.g., Manhattan, Italy Map
 - Progression of ideas: Connect as a story
 - e.g., May I have a large container of coffee? (3.1415926)
 - Syntactic Coherence: As grammatical as possible
 - Short encoding: Size of the story
 - e.g., 1101 0110 1100 vs 13 6 12

What's wrong with mnemonics?

- Has to be easy to remember:
 - An apple a day sends the doctor away*
- Has to be hard to guess:
 - Regularity in language can be a pitfall:
 - My (dog|cat|pet)'s name is (fido|dusty...) →
M(d|c|p)ni?
 - $P(\text{mother}) \neq P(\text{mother} | \text{birth})$
 - Need high entropy word sequences
- Mnemonic fatigue:
 - Hard to come up with new memorable mnemonics
 - Multiple accounts
 - Periodic password reset

Mnemonic Generation

- Start with:
 - Set of human-crafted memorable sentences
 - Set of words, $R_{s,i} = d(W_i)$
- Result:
 - Set of mnemonic sentences for $R_{s,I}$
 - Grammatical
 - Probably easy to remember
- Use a subset of English
 - Restricted, $P(W_i) = P(W_i | W_j)$
 - Large enough for passwords

Conclusion

- People are good in keeping cards secure
- Many already use mnemonics
- First step
 - **Single** mnemonic for **multiple** Passwords
 - Good **security** and **usability**
- Periodic password changes now easy
- Shared passwords possible
- Recall rarely used passwords

Future work

- Further improve against brute force
- More effective use of Natural Language Processing
- USENIX'07: Authentication In Constrained Environments
